// Name:          CubicBezierCurve.c++        cubic Bezier curve class
//
// Description:
//      This code supports the Bezier curve operations in the Cookie
//      Manager class. These include operations to manipulate the control
//      points, and subdivision operations.
//
// Author:
//      Jack Lees,      Magic Earth
//
// Traceability:
//                      initial release
//-------------------------------------------------------------------------//
Description:
//      Constructor.
//
//-------------------------------------------------------------------------//
Description:
//      Destructor.
//
//-------------------------------------------------------------------------
// Description:
//      Deletes a segment of the curve
//
//-------------------------------------------------------------------------
// Description:
//      Deletes the curve
//
//-------------------------------------------------------------------------
// Description:
```

```
                                    EZFaultCode
//      Inserts a new marker after the current marker and adjusts the planes.
//
//----------------------------------------------------------------------------
// Description:
//      add control point(s)
//
//----------------------------------------------------------------------------
// Description:
//      add vertices
//
//----------------------------------------------------------------------------
// Description:
//       insert vertices
//
//----------------------------------------------------------------------------
// Description:
//      figure out control point positions
//
//----------------------------------------------------------------------------
// Description:
//      update the control points
//
//----------------------------------------------------------------------------
// Description:
//      update the control points
//
//----------------------------------------------------------------------------
// Description:
//      Implements the subdivision algorithm.
//
//----------------------------------------------------------------------------
// Description:
//      Rebuilds list of connecting lines based on the current list of vertices.
//      Locks a private copy of the GeoSet so it is MP-safe to realloc the list
//      of line coordinates.  List size is doubled as needed.  Note, the number
//      of lines is equal to the number of vertices-1.  The number of coords is
//      equal to the number of lines*2.
//
//----------------------------------------------------------------------------
// Description:
//      Loads the initial components of the CubicBezierCurve scene graph.
//      Creates the fluxed GeoSets for the curve segments.
//----------------------------------------------------------------------------
// Description:
//      Callback creates a fluxed GeoSet for the line segments.  Will be called
//      multiple times when runing in MP mode.  Initializes the line attributes,
//      allocates initial space for the coords and color.
//
//-------------------------------------------------------------------------//
Description:
//      Update the curves with the given relative translation.
//
//   -*- C++ -*-
